

Part B Triage in the Emergency Room – Let’s Get More Information

While you were performing your triage evaluation, hospital staff continued to monitor the patients’ vital signs. This new information will help you reprioritize the order of care.

1. Read the *First Priority* handout. Discuss the importance of the new information about Monique, Nelson and Albert.
2. With your team, reevaluate the order you should treat each remaining patient. Record your order of priority in the “part B modified priority” column of the *Triage Data Sheet*. The new order may be different from the order you wrote in the first column.
3. Record your reasoning for the rankings you made for part B.
4. Read the *Additional Information* handout to learn the outcome of your secondary triage decisions.
5. What is the long-term outlook for each patient, now that each has moved out of the emergency room. What is your reasoning? For example, you might think that some patients will recover completely, others will recover slowly and may suffer long-lasting effects, and other may never recover and even die because of their injuries or illnesses.
